# 1 Preface

## 2 Goal

The goal is a software which performs image classification and is able to switch between deploy platforms and working modes. It also should have a GUI to control the software and to show the results.

## 3 Product use

Image classification

## 4 Acceptance criteria

### 4.1 Must

<b>AC10</b>	<b>Image classification</b> The software can take a single image as input and tell the user to which predefined class, if any, this image belongs.
<b>MAC020</b>	<b>Running neural network on a heterogeneous platform</b> The software is able to do the execution of a given neural network (inference) on different compute devices. At least one CPU and one FPGA should be supported. The user is able to choose which compute device should be used for his image.
<b>AC30</b>	<b>Different operating modes</b> The software has three modes. One mode for high performance, one for low power consumption and one for high energy efficiency.
<b>AC40</b>	<b>GUI for interacting with software</b> The user should be able to access the entire functionality described in AC10-AC50 just by using the functional GUI. No coding or command line usage is required.
<b>AC50</b>	<b>Performance and power consumption prediction</b> The software can predict the performance with a certain powerconsumption and also the powerconsumption for a certain performance.

## 4.2 Can

- KAC070 Illustration of the topology of a nn**  
The software is able to visualize the topology of a given nn in a usefull way without requirering additional information.  
The visualized nn can be saved as a .png file
- KAC100 Creating new models**  
The software allows the user to train a neural network based on an architecture which the user developed.  
Neural networks created and trained by the user will be executed the same way neural networks provided with the software are executed.
- KAC110 Voting of multiple nn**  
The user is able to choose multiple nn for classification.  
The software will then execute all selected neural networks sequentially.  
The result presented to the User will be based on the weighted opinions of the different neural networks.
- KAC120 Using video for classification**  
The software is able to take a video, divide it in frames and perform image classification for each frame.  
The classified video can be viewed side by side as if changing to the next image at a constant rate and the classification could be saved as a JSON or an XML file.
- KAC130 Using camera for classification input**  
The software is able to take frames captured with a camera as an input and classify them.  
The process could take the current frame, classify it, display the results and then when ready, take the next available frame.

KAC060 : Training a nn for classification

KAC080 : Object detection

KAC090 : Choosing between different models

KAC140 : Running NN on GPU

KAC150 : The GUI covers all implemented features in 4.1 and 4.2

## 5 Functional Requirements Must

MFR025 : Dispatching the calculation process defined from the mode

MFR030 : Support CPU for calculation

MFR031 : Support FPGA for calculation

MFR032 : Support GPU for calculation

MFR040 : Communication between Host-PC and platform

MFR041 : Send image for classification

MFR042 : Receive result  
MFR050 : GUI  
MFR060 : Showing results

<b>MFR010</b>	<b>Use neural network for image classification</b> A neural network should be used in order to classify images based on what is shown on them. For each image a list of possible classes it could belong to along with degree of confidence should be given as output.
<b>MFR011</b>	<b>Deploy pre-trained neural network with the corresponding layers</b> A pre-trained neural network should be deployed to with all the corresponding layers in order to fulfill MFR010.
<b>MFR012</b>	<b>Reading and parsing neural network configuration/weight file</b> The software is able to a configuration file of a specific neural network and parse it for use in the classification.
<b>MFR020</b>	<b>Have high performance operating mode</b> An option to perform calculations fast with low regard for power consumption.
<b>MFR021</b>	<b>Have low power consumption operating mode</b> An option to perform calculations with low power consumption and low regard for speed.
<b>MFR022</b>	<b>Have high energy efficiency operating mode</b> An option to perform calculations at an adequate balance between speed and power consumption.
<b>MFR023</b>	<b>Calculator for power consumption</b> Calculations for the possible power consumption running the image classifications would result in based on the neural network, platform and operating mode used.
<b>MFR024</b>	<b>Calculator for performance</b> Calculations for the possible performance running the image classifications would result in based on the neural network, platform and operating mode used.
<b>FR070</b>	<b>Choosing image for classification</b> Testet with: Implements: The GUI has a button with an on click event which opens a file explorer. The explorer filters the files so that only files of the format .jpg, .png, .bmp are listed. That also are the only valid formats.
<b>FR080</b>	<b>Choosing platform/hardware</b> Testet with: Implements: The GUI has a dropdown which lists the devices on which the classification can be done. The devices which can be theoretically be accessed but aren't connected to the host pc or the communication with them doesn't work are grayed out.
<b>FR090</b>	<b>Choosing mode</b> Testet with: Implements: 6 The GUI has dropdown which lists the modes (high performance mode, low power consumption mode and best energy efficiency mode). The power consumption in Watts and performance in FLOPs are also stated behind the mode names.

## 6 Functional Requirements Can

- FR100**      **Choosing between different models**  
Testet with: Implements:  
The GUI has a button which opens the file explorer which filters for .txt files, there you choose the config file of the neural network with which you want to use. The program loads this config and parses it so it can be deployed. Possible models are GoogLeNet or AlexNet.
- FR110**      **Train nn for classification of imageset (with transfer learning)**  
Testet with: Implements:  
The user chooses a pretrained neural network and a new imageset and then can train the neural network on this new imageset with transfer learning.

KFR032 : Support GPU for calculation  
KFR113 : Backpropagation  
KFR114 : Choosing parameters like learning rate  
KFR120 : Illustrating nn topology  
KFR130 : Object detection algorithm  
KFR131 : Showing detected object  
KFR132 : Choosing between detection and classification mode

## 7 Productdata

- PD010**      **Images for classification**  
The user can choose images of the format .jpg, .png, .bmp. The images are chosen by the user with the file explorer.
- PD020**      **Config/weight file of pretrained model**  
It is a .cfg file. In the beginning are hyperparameters described with the format *name = value*. Then the layers are described in their order with the following format  
*[kind of layer]*  
list of parameters in the format *name = value*
- PD030**      **Labeled image set for classification training**  
The dataset is chosen by the user. The dataset is a directory with images and the name of the image is the label.
- PD040**      **Labeled set of images for object detection training**  
It is a .txt file and a directory with images. The images are labeled with their name. The bounding box for each image are described in the .txt file, in the format *imagename, x,y,width,height*. (X,Y) are the coordinates in pixel of the left bottom corner, the width and height are in pixel.

## 8 Demarcation

- D010      No low-level optimization**  
Optimizations to reduce the execution time of object classification and detection will mainly be carried out in OpenCL.  
No optimizations including low-level languages or assembly intrinsics will be implemented.
- D020      No real time optimization**  
Common code optimizations will be done where possible to reduce the running time of the network per image classification/detection task.  
They do not have to lead to real-time reactions of the system.  
A computation time of multiple seconds per image is acceptable.
- D030      No neural network size optimization**  
No techniques for memory usage reduction like parameter sharing, pruning or binarization will be implemented.
- D040      No mobile support**  
There are no intentions to run any parts of this code on a mobile device like a smartphone or Augmented Reality glass.  
Mobile device requirements are not taken into consideration when choosing Techniques, languages and hardware used in this project.

## 9 Non-functional requirements

NF10

## 10 Test cases

T010	<b>Use neural network for image classification</b> <b>State:</b> A image is given as an input. <b>Action:</b> Calculations are performed on hand of the image and a neural network. <b>Reaction:</b> A list of possible classes the given image could belong to along with degree of confidence for each class are given as output.
T011	<b>Deploy pre-trained neural network with the corresponding layers</b> <b>State:</b> There is a neural network (already trained). <b>Action:</b> Calculations are performed cased on a given image and the given neural network. <b>Reaction:</b> A list of possible classes the given image could belong to along with degree of confidence for each class are given as output.
T012	<b>Reading and parsing neural network configuration/weight file</b>
T012.1	<b>State:</b> The user is on the page to select a neural network to use for the image classification. <b>Action:</b> The user selects the option to import a neural network. <b>Reaction:</b> The file explorer opens.
T012.2	<b>State:</b> The file explorer is open <b>Action:</b> The user selects an neural network to import <b>Reaction:</b> The file explorer closes and neural network is imported and selected for the classification calculations.
T020	<b>Have high performance operating mode</b> <b>State:</b> The user is ready to start the calculations. <b>Action:</b> The user chooses to perform the calculations in high performance operating mode. <b>Reaction:</b> The calculations run considerably faster than in the other possible modes with the same conditions.
T021	<b>Have low power consumption operating mode</b> <b>State:</b> The user is ready to start the calculations. <b>Action:</b> The user chooses to perform the calculations in low power consumption operating mode. <b>Reaction:</b> The calculations run with considerably lower power consumption than with the other possible modes in the same conditions.
T022	<b>Have high energy efficiency operating mode</b> <b>State:</b> The user is ready to start the calculations. <b>Action:</b> The user chooses to perform the calculations in high energy efficiency operating mode. <b>Reaction:</b> The calculations run with regard to balance between power consumption and speed.
T070	<b>Choosing image for classification</b>
T070.1	<b>State:</b> The user is on the page for image classification. <b>Action:</b> The user clicks on the button „Choose image“. <b>Reaction:</b> The file explorer opens with the filter for .png, .jpg, .bmp
T070.2	<b>State:</b> The file explorer is open <b>Action:</b> The user selects an image with a valid format <b>Reaction:</b> The file explorer closes and image is as preview shown

<b>T080</b>	<b>Choosing platform/hardware</b>
T080.1	<p><b>State:</b> The user is on the page for image classification</p> <p><b>Action:</b> The user chooses with the dropdown the desired platform</p> <p><b>Reaction:</b> An internal flag is set to the desired platform and the dropdown shows the chosen platform.</p>
<b>T090</b>	<b>Choosing mode</b>
T090.1	<p><b>State:</b> The user is on the page for image classification</p> <p><b>Action:</b> The user chooses with the dropdown the desired mode</p> <p><b>Reaction:</b> An internal flag is set to the desired mode and the dropdown shows the chosen mode</p>
<b>T100</b>	<b>Choosing between different models</b>
T100.1	<p><b>State:</b> The user is on the page for image classification</p> <p><b>Action:</b> The user clicks on the button „Choose neural network“</p> <p><b>Reaction:</b> The file explorer opens</p>
T100.2	<p><b>State:</b> The file explorer is open</p> <p><b>Action:</b> The user selects an config/weight file</p> <p><b>Reaction:</b> The file explorer closes and the software loads the input and parses it. If it is loaded there is success message</p>
<b>T110</b>	<b>Train neural network for classification of imageset</b>
T110.1	<p><b>State:</b> The user is on the page for training, has selected a neural network, a dataset for training, the kind of training, the learning rate and the desired precision.</p> <p><b>Action:</b> The user clicks on the button „Train“</p> <p><b>Reaction:</b> The software starts to train the selected network with the selected configuration and shows the progress in line graph.</p>
<b>T111</b>	<b>Saving a NN after training</b>
T111.1	<p><b>State:</b> The user is on the page for training, has selected a neural network, a dataset for training, the kind of training, the learning rate and the desired precision.</p> <p>The training finishes.</p> <p><b>Action:</b> No action required</p> <p><b>Reaction:</b> The software stores the trained network weights in a predefined format and with a usefull name in a fixed location.</p>
<b>T112</b>	<b>Choosing/Reading data set</b>
T112.1	<p><b>State:</b> A folder containing images is provided by the user.</p> <p><b>Action:</b> No action required</p> <p>The software is able to read all images matching the allowed formats and allows training and inferencing on these images.</p>
<b>T140</b>	<b>Creating new topology</b>
T140.1	<p><b>State:</b></p> <p><b>Action:</b> No action required</p> <p><b>Reaction:</b></p> <p>A folder containing images is provided by the user.</p> <p>The software is able to read all images matching the allowed formats and allows training and inferencing on these images.</p>

T150 T150.1	<b>Choosing between training and interference mode</b> <b>State:</b> <b>Action:</b> No action required <b>Reaction:</b> A folder containing images is provided by the user. The software is able to read all images matching the allowed formats and allows training and inferencing on these images.
T160 T160.1	<b>Choosing video in format .avi</b> <b>State:</b> The software is running. <b>Action:</b> The user selects a .avi video file. <b>Reaction:</b> The system stores the path to the selected video and is available to process single images from this video.
T161 T161.1	<b>Apply classification for a certain amount of frames</b> <b>State:</b> The software is running. A video source was chosen by the user. All network details were provided by the user. Classification was chosen by the user. <b>Action:</b> The user clicks on the button “start classification” <b>Reaction:</b> The system processes the video file imagewise
T170 T170.1	<b>Connect with camera</b> <b>State:</b> The software is running <b>Action:</b> The user connects a usb camera to the pc <b>Reaction:</b> The system dynamically detects the camera and allows the user to select the camera as an image source
T171 T171.1	<b>Receive video stream from camera</b> <b>State:</b> The software is running, a camera is connected to the host pc. <b>Action:</b> The user chooses the camera as image source. <b>Reaction:</b> The first camera image is provided as a preview, the continuous image stream is available for further processing.
T180 T180.1	<b>Detecting object</b> <b>State:</b> The software is running, a network including all parameters and weights was provided. An image was provided. Detection mode was picked by the user <b>Action:</b> The user clicks on the button “start detection” <b>Reaction:</b> The network is run for inferencing and the network output is shown to the user.
T181 T181.1	<b>Drawing bounding box</b> <b>State:</b> Inferencing was executed on an image given by the user, the chosen neural network predicted bounding boxes. <b>Action:</b> No action required <b>Reaction:</b> The original image, given by the user, is overlayed with the boxes predicted by the network, the updated image is presented to the user.

## **11 System models**

### **11.1 Scenarios**

#### **11.1.1 Scenario 1**

The user U1 wants to classify the image of a cat. He goes on the classification page and he clicks on the dropdown and sees the three modes „low power consumption“, „high performance“ and „high energy efficiency“, he can also see the predicted power consumption and performance. He chooses to classify in the low power mode and runs the program. The results are shown.

#### **11.1.2 Scenario 2**

The user U2 goes to the classification page and chooses the image of coal and the high power performance mode and CPU mode. The software states that it would take 86 watts with 166 GFLOPs. U2 decides he would rather use the high energy efficiency mode with 140 GFLOPs and 70 watts. He sets the other parameters and clicks on Start image classification. The result is that the image is a coal and shows this result.

#### **11.1.3 Scenario 3**

The user U3 created the blueprint for a new nn. He wants to train a network based on this config file but computation time is shared and expensive. U3 has to convince his boss therefore. U3 uses the software as input and select the visualization toolkit. U3 saves the output and uses it during the discussion to demonstrate the advantages of his new neural network.

#### **11.1.4 Scenario 4**

User U4 has to categorize a large dataset of plants from a biology excursion. U4 has two trained neural networks for this task. The first with a good accuracy and high confidence on leaves. The second with a high confidence and accuracy on flowers. On unknown objects they both tend to have a low confidence. U4 does not want to pick manually for every image which network to use. He also does not want to train a new neural network. Therefore U4 selects both networks and the folder with the new images inside, as well as

the parameters save-result and dont-show results. The software classifies all images in a few minutes and he is able to handover the dataset for further documentation.

#### **11.1.5 Scenario 5**

User U5 has heard about this software and wants to test it. U5 is a pokemon fan, therefore he decides to use a new neural network to classify the newest generation pokemon. None of the provided networks was trained for that task, so U5 decides to train a new neural network. U5 copies an existing neural network layout file and adds a 5 fully connected layers in between, to create a target neural network. U5 uses his large pokemon image dataset, his new neural network layout file and the software, to train a new neural network. Afterwards U5 creates a folder with new pokemon images and uses his new network and the software to classify them.

### **11.2 Usecases**

#### **11.2.1 Training page**

#### **11.2.2 Training page**

### **11.3 GUI**

Abbildung 1: Usecase of the image classification page

## Glossar

**image** a two dimensional matrix of red,green,blue (RGB) values that can be visualized as each cell represents a single pixel on the monitor. (ex.: a photo).

**neural network** a network or a circuit of neuron used for information processing inspired by the way biological neural systems process data.

Abbildung 2: Usecase of the trainingspage

## 12 Stage responsibilities

<b>Requirements:</b>	Paul Stangel
<b>Design:</b>	Johannes Häring
<b>Implementation:</b>	Manuel Drehwald
<b>Quality insurance:</b>	Stefani Guneshka
<b>Deployment:</b>	Dimitar Dimitrov
